

Overall, UVA receives considerably less foreign money than other similar public state universities. While some of these schools like the University of Michigan, Berkeley, and UCLA have much higher student populations and thus require more funding, UVA still lags far behind comparable institutions like UNC. Overall my main recommendations are for UVA to pursue closer ties with China, and work with UNC to build a greater connection with Canada. Additionally, both China and Canada give large amounts of gifts, so securing giftors from those countries likely wouldn't be overly difficult for an institution as well respected as UVA.

As expected, the institutions receiving the largest amounts are private world renowned universities such as the Ivy League Schools and MIT. The countries who give the most are mostly very wealthy countries like Qatar, Saudi Arabia, and the UK. There are some sporadic interesting combinations of institutions and countries, for example Bermuda (part of the UK but still an interesting donor source) donated \$750,000,000 dollars to Carnegie Mellon, which is much larger than most institutes' total gift amounts combined.

The most individual gifts are given by the UK, China, Canada, Japan, and Switzerland. This makes a lot of sense, as all of these countries house some of the world's most elite universities and are highly prominent in many areas of research. These countries are all highly successful and heavily emphasize academia and have a highly populous upper class, many of whom have extensive connections with American universities. Interestingly, the countries who receive the most individual gifts are fairly different from the ones receiving the largest total amounts of money. The institute who has received the most individual gifts isn't an Ivy League school but is in fact UCLA, not to mention the second greatest receiver of individual gifts is the California Institute of Technology. With these being California schools, these schools along with Berkely receive considerable amounts of money from East Asia. Countries like China invest heavily in the many technology companies in California, so it makes a lot of sense that Chinese donors give a lot to California schools.

In terms of securing more foreign gifts for UVA, again it would be best for UVA to try and get giftors from China. This could be done through introducing highly developed exchange programs between UVA and Chinese universities. Additionally, UVA could donate some of its own money or provide research to Chinese institutes to garner good favor with Chinese donors. Canada also gives large amounts of gifts to American universities, so again I would suggest partnering with UNC and a few Canadian institutes to gain donors. UVA could also bolster its French program and hire French Canadian professors and researchers to build a greater connection with Canada.
